

REMEMBER FORWARD

TITANIUM SPHERE TIME CAPSULE

The premium long-duration design. 10,000+ year lifespan.

GRADE 5 Ti-6Al-4V · ARGON ATMOSPHERE · \$350–\$600

Why Titanium?

Grade 2 CP titanium is one of the most chemically inert structural metals available. It does not rust. It resists acid, alkali, and saltwater corrosion. It maintains structural integrity at temperatures from cryogenic to 300°C. A sealed titanium sphere in stable geological conditions has a realistic survival horizon of 10,000 years or more.

Specifications

Component	Specification	Purpose
Outer shell	Grade 5 Ti-6Al-4V, 6" sphere, 3mm wall	Primary protection, chemical resistance
O-rings	Welded closure — no elastomer	Rate ANY elastomer closure at 100–300 years, not 10,000. Weld it if it must outlast that.
Inner frame	Octahedron geometry, same titanium alloy	Load distribution, plate protection
Pyramid cavity	Center of chamber, apex at 51.83° Giza angle	Geometric preservation feature
Atmosphere	Argon gas fill — inert, displaces oxygen	Prevents oxidation of plate surfaces
Insulation	Silica aerogel lining	Thermal buffering, moisture exclusion
Desiccant	Molecular sieve, sealed pouches	Backup moisture absorption

Plate Set Capacity

A standard 6-inch titanium sphere comfortably accommodates all 214 plates plus audio discs in a complete Tier 3 plate set. Stack height of Tier 3 is approximately 345mm (13.6 inches), which fits vertically in a 6-inch sphere with the octahedron inner frame.

Why This Design for The Patient Message

The titanium sphere carries a large plate set in a compact, shippable volume. The argon atmosphere prevents plate surface oxidation, and the silica aerogel buffers temperature extremes that would otherwise stress the metal over centuries. Be clear about the seal: Viton O-rings are rated in years to decades, not millennia, so an O-ring vessel is a 100-to-300 year capsule with a 10,000 year shell. For a sited cache

intended to outlast that, the closure must be welded — no elastomer at any price.

If you can afford only one premium capsule, make it a titanium sphere with a Tier 3 plate set and audio discs. This is the closest thing to a guaranteed 2,000-year archive that current materials science can produce.
