

REMEMBER FORWARD

OCEAN SURVIVAL TIME CAPSULE

Designed for 2,000 years at sea. Buoyant and pressure-rated. Self-righting is NOT verified — see below.

HDPE HULL · ZINC ANODES · Ti PRESSURE VESSEL · \$400–\$900

Why an Ocean Capsule?

Land-based capsules face threats from excavation, construction, soil chemistry, and human activity. Ocean floor capsules at 200 to 600 meter depth face almost none of these threats. Below wave action, above the worst pressure depths, in stable cold water, ocean capsules can survive largely undisturbed for millennia.

The ocean capsule is unreachable by most surface activity, untraceable without sophisticated equipment, and protected by the sheer scale of the ocean floor. No organization can collect or suppress thousands of ocean capsules distributed across international waters.

Critical Requirements for Ocean Deployment

Titanium plates are the standard for ocean capsules. Titanium is inert in seawater, which is why it is used for ship fittings and submersible hardware, and it needs no plating. The earlier gold-plated nickel requirement belonged to the nickel design and no longer applies. Fired stoneware plates also survive seawater — blue-and-white porcelain from the Belitung and Nanhai wrecks spent a thousand years submerged with its cobalt still vivid — provided the body is vitrified and the plates are cushioned against impact. Audio discs should use DMM copper with gold plating.

Specifications

Component	Specification	Purpose
Outer hull	HDPE (High-Density Polyethylene)	Chemical resistance to seawater, buoyancy
Sacrificial anodes	Zinc alloy, bolted externally	Cathodic protection — zinc corrodes sacrificially, protecting all metal components
Pressure vessel	Grade 5 titanium, rated to 600 atm (~6,000m depth)	Protects plates at any ocean depth
Ballast	Lead keel weight	Self-righting is UNVERIFIED. No buoyancy or centre-of-mass calculation is on record. Do not rely on it.
Plates	Titanium — inert in seawater, no plating needed	Saltwater corrosion resistance
Audio discs	DMM copper + gold plating	Saltwater corrosion resistance

Component	Specification	Purpose
Depth rating	600 atm (6,000m)	Survives any ocean depth on Earth

Deployment

Deploy in international waters beyond any national jurisdiction, at depths below 200 meters. Mark GPS coordinates in at least three independent records held by unconnected individuals. The capsule should be considered lost on deployment — designed to be found by a future civilization, not recovered by the present one.
